Current-Limited, Power-Distribution Switches

FEATURES

- **Single Power Switch Family**
- **Pin for Pin with Existing *TI Switch Portfolio***
- **Rated currents of 0.5 A, 1 A, 1.5 A, 2 A**
- **±20% Accurate, Fixed, Constant Current Limit**
- **Fast Over-Current Response – 2 µs**
- **Deglitched Fault Reporting**
- **Selected Parts with (TPS20xxC) and without (TPS20xxC-2) Output Discharge**
- **Reverse Current Blocking**
- **Built-in Softstart**
- **Ambient Temperature Range: –40°C to 85°C**
- **UL Listed and CB-File No. E169910**

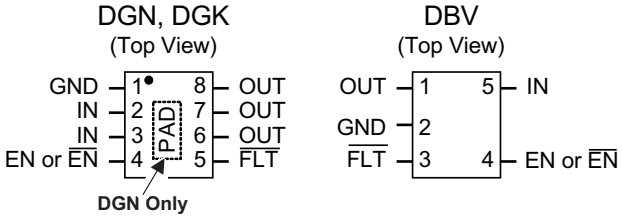
APPLICATIONS

- **USB Ports/Hubs, Laptops, Desktops**
- **High-Definition Digital TVs**
- **Set Top Boxes**
- **Short-Circuit Protection**

DESCRIPTION

The TPS20xxC and TPS20xxC-2 power-distribution switch family is intended for applications such as USB where heavy capacitive loads and short-circuits are likely to be encountered. This family offers multiple devices with fixed current-limit thresholds for applications between 0.5 A and 2 A.

The TPS20xxC and TPS20xxC-2 family limits the output current to a safe level by operating in a constant-current mode when the output load exceeds the current-limit threshold. This provides a predictable fault current under all conditions. The fast overload response time eases the burden on the main 5 V supply to provide regulated power when the output is shorted. The power-switch rise and fall times are controlled to minimize current surges during turn-on and turn-off.



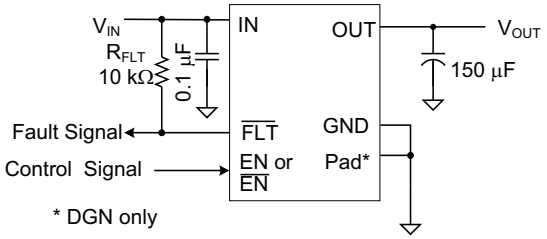


Figure 1. Typical Application

Table 1. DEVICES(1)

MAXIMUM OPERATING CURRENT	DEVICES	STATUS		
		MSOP-8 (PowerPad™)	SOT23-5	MSOP-8
0.5	TPS2041C and 51C	—	Active and Active	—
1	TPS2061C and 65C	Active and Active	Active and Active	—
1	TPS2065C-2	Active	Active	—
1.5	TPS2068C and 69C	Active and Active	— and Active	—
1.5	TPS2069C-2	Active	—	—
2	TPS2000C and 01C	Active and Active	—	Active and Active

(1) For more details, see the DEVICE INFORMATION table.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PowerPad is a trademark of Texas Instruments.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

DEVICE INFORMATION(1)

MAXIMUM OPERATING CURRENT	OUTPUT DISCHARGE	ENABLE	BASE PART NUMBER	PACKAGED DEVICE AND MARKING(2)		
				MSOP-8 (DGN) PowerPAD™	SOT23-5 (DBV)	MSOP-8 (DGK)

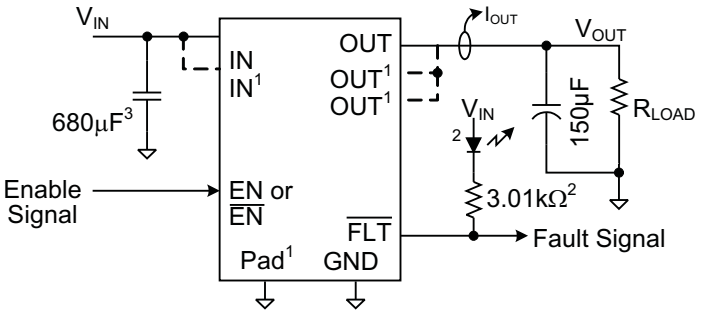
DEVICE INFORMATION

PIN FUNCTIONS

NAME	PINS	DESCRIPTION
8-PIN PACKAGE		
EN or $\overline{EN}$	4	Enable input, logic high turns on power switch
GND	1	Ground connection
IN	2, 3	Input voltage and power-switch drain; connect a 0.1 µF or greater ceramic capacitor from IN to GND close to the IC
$\overline{FLT}$	5	Active-low open-drain output, asserted during over-current, or over-temperature conditions
OUT	6, 7, 8	Power-switch output, connect to load
PowerPAD (DGN ONLY)	PAD	Internally connected to GND. Connect PAD to GND plane as a heatsink for the best thermal performance. PAD may be left floating if desired. See POWER DISSIPATION AND JUNCTION TEMPERATURE section for guidance.
5-PIN PACKAGE		
EN or $\overline{EN}$	4	Enable input, logic high turns on power switch
GND	2	Ground connection
IN	5	Input voltage and power-switch drain; connect a 0.1 µF or greater ceramic capacitor from IN to GND close to the IC
$\overline{FLT}$	3	Active-low open-drain output, asserted during over-current, or over-temperature conditions
OUT	1	Power-switch output, connect to load.

TYPICAL CHARACTERISTICS



(1) Not every package has all pins
(2) These parts are for test purposes

DETAILED DESCRIPTION

The TPS20xxC and TPS20xxC-2 are current-limited, power-distribution switches providing between 0.5 A and 2 A of continuous load current in 5 V circuits. These parts use N-channel MOSFETs for low resistance, maintaining voltage regulation to the load. They are designed for applications where short circuits or heavy capacitive loads will be encountered. Device features include enable, reverse blocking when disabled, output discharge pulldown, overcurrent protection, over-temperature protection, and deglitched fault reporting.

UVLO

The undervoltage lockout (UVLO) circuit disables the power switch until the input voltage reaches the UVLO turn-on threshold. Built-in hysteresis prevents unwanted on/off cycling due to input voltage drop from large current surges. $\overline{FLT}$ is high impedance when the TPS20xxC and TPS20xxC-2 are in UVLO.

ENABLE

The logic enable input (EN, or $\overline{EN}$), controls the power switch, bias for the charge pump, driver, and other circuits. The supply current is reduced to less than 1 µA when the TPS20xxC and TPS20xxC-2 are disabled. Disabling the TPS20xxC and TPS20xxC-2 will immediately clear an active $\overline{FLT}$ indication. The enable input is compatible with both TTL and CMOS logic levels.

The turnon and turnoff times (t_{ON}, t_{OFF}) are composed of a delay and a rise or fall time (t_R, t_F). The delay times are internally controlled. The rise time is controlled by both the TPS20xxC and TPS20xxC-2 and the external loading (especially capacitance). TPS20xxC fall time is controlled by the loading (R and C), and the output discharge (R_{PD}). TPS20xxC-2 does not have the output discharge (R_{PD}), fall time is controlled by the loading (R and C). An output load consisting of only a resistor will experience a fall time set by the TPS20xxC and TPS20xxC-2. An output load with parallel R and C elements will experience a fall time determined by the (R × C) time constant if it is longer than the TPS20xxC and TPS20xxC-2's t_F.

The enable should not be left open, and may be tied to VIN or GND depending on the device.

INTERNAL CHARGE PUMP

The device incorporates an internal charge pump and gate drive circuitry necessary to drive the N-channel MOSFET. The charge pump supplies power to the gate driver circuit and provides the necessary voltage to pull the gate of the MOSFET above the source. The driver incorporates circuitry that controls the rise and fall times of the output voltage to limit large current and voltage surges on the input supply, and provides built-in soft-start functionality. The MOSFET power switch will block current from OUT to IN when turned off by the UVLO or disabled.

CURRENT LIMIT

The TPS20xxC and TPS20xxC-2 responds to overloads by limiting output current to the static I_{OS} levels shown in the Electrical Characteristics table. When an overload condition is present, the device maintains a constant output current, with the output voltage determined by (I_{OS} × R_{LOAD}). Two possible overload conditions can occur.

The first overload condition occurs when either: 1) input voltage is first applied, enable is true, and a short circuit is present (load which draws $I_{OUT} > I_{OS}$), or 2) input voltage is present and the TPS20xxC and TPS20xxC-2 are enabled into a short circuit. The output voltage is held near zero potential with respect to ground and the TPS20xxC and TPS20xxC-2 ramps the output current to I_{OS}. The TPS20xxC and TPS20xxC-2 will limit the current to I_{OS} until the overload condition is removed or the device begins to thermal cycle. This is demonstrated in Figure 13 where the device was enabled into a short, and subsequently cycles current off and on as the thermal protection engages.

The second condition is when an overload occurs while the device is enabled and fully turned on. The device responds to the overload condition within t_{IOS} (Figure 6 and Figure 7) when the specified overload (per Electrical Characteristics table) is applied. The response speed and shape will vary with the overload level, input circuit, and rate of application. The current-limit response will vary between simply settling to I_{OS}, or turnoff and controlled return to I_{OS}. Similar to the previous case, the TPS20xxC and TPS20xxC-2 will limit the current to I_{OS} until the overload condition is removed or the device begins to thermal cycle. This is demonstrated by Figure 14, Figure 15, and Figure 16.

The TPS20xxC and TPS20xxC-2 thermal cycles if an overload condition is present long enough to activate thermal limiting in any of the above cases. This is due to the relatively large power dissipation [(V_{IN} – V_{OUT}) x I_{OS}] driving the junction temperature up. The device turns off when the junction temperature exceeds 135°C (min) while in current limit. The device remains off until the junction temperature cools 20°C and then restarts.

There are two kinds of current limit profiles typically available in TI switch products similar to the TPS20xxC and TPS20xxC-2. Many older designs have an output I vs V characteristic similar to the plot labeled "Current Limit with Peaking" in Figure 42. This type of limiting can be characterized by two parameters, the current limit corner (I_{OC}), and the short circuit current (I_{OS}). I_{OC} is often specified as a maximum value. The TPS20xxC and TPS20xxC-2 family of parts does not present noticeable peaking in the current limit, corresponding to the characteristic labeled "Flat Current Limit" in Figure 42. This is why the I_{OC} parameter is not present in the Electrical Characteristics tables.

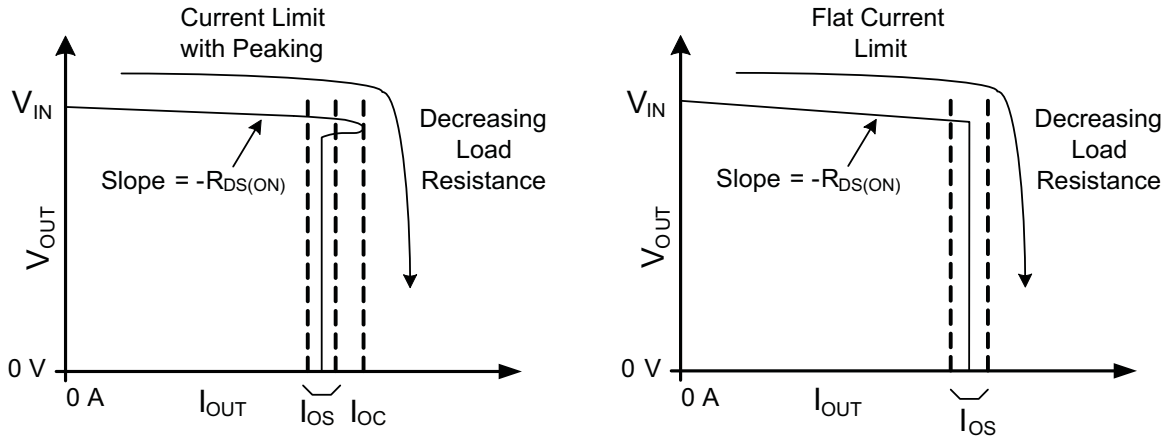

Figure 42. Current Limit Profiles

$\overline{\text{FLT}}$

The $\overline{\text{FLT}}$ open-drain output is asserted (active low) during an overload or over-temperature condition. A 9 ms deglitch on both the rising and falling edges avoids false reporting at startup and during transients. A current limit condition shorter than the deglitch period will clear the internal timer upon termination. The deglitch timer will not integrate multiple short overloads and declare a fault. This is also true for exiting from a faulted state. An input voltage with excessive ripple and large output capacitance may interfere with operation of $\overline{\text{FLT}}$ around I_{OS} as the ripple will drive the TPS20xxC and TPS20xxC-2 in and out of current limit.

If the TPS20xxC and TPS20xxC-2 are in current limit and the over-temperature circuit goes active, $\overline{\text{FLT}}$ will go true immediately (see Figure 14) however exiting this condition is deglitched (see Figure 16). $\overline{\text{FLT}}$ is tripped just as the knee of the constant-current limiting is entered. Disabling the TPS20xxC and TPS20xxC-2 will clear an active $\overline{\text{FLT}}$ as soon as the switch turns off (see Figure 13). $\overline{\text{FLT}}$ is high impedance when the TPS20xxC and TPS20xxC-2 are disabled or in under-voltage lockout (UVLO).

OUTPUT DISCHARGE

A 470Ω (typical) output discharge will dissipate stored charge and leakage current on OUT when the TPS20xxC is in UVLO or disabled. The pull-down circuit will lose bias gradually as V_{IN} decreases, causing a rise in the discharge resistance as V_{IN} falls towards 0 V. The TPS20xxC-2 does not have this function. The output is be controlled by an external loadings when the device is in ULVO or disabled.

APPLICATION INFORMATION

INPUT AND OUTPUT CAPACITANCE

Input and output capacitance improves the performance of the device; the actual capacitance should be optimized for the particular application. For all applications, a 0.1 µF or greater ceramic bypass capacitor between IN and GND is recommended as close to the device as possible for local noise decoupling.

All protection circuits such as the TPS20xxC and TPS20xxC-2 will have the potential for input voltage overshoots and output voltage undershoots.

Input voltage overshoots can be caused by either of two effects. The first cause is an abrupt application of input voltage in conjunction with input power bus inductance and input capacitance when the IN terminal is high impedance (before turn on). Theoretically, the peak voltage is 2 times the applied. The second cause is due to the abrupt reduction of output short circuit current when the TPS20xxC and TPS20xxC-2 turns off and energy stored in the input inductance drives the input voltage high. Input voltage droops may also occur with large load steps and as the TPS20xxC and TPS20xxC-2 output is shorted. Applications with large input inductance (e.g. connecting the evaluation board to the bench power-supply through long cables) may require large input capacitance reduce the voltage overshoot from exceeding the absolute maximum voltage of the device. The fast current-limit speed of the TPS20xxC and TPS20xxC-2 to hard output short circuits isolates the input bus from faults. However, ceramic input capacitance in the range of 1µF to 22µF adjacent to the TPS20xxC and TPS20xxC-2 input aids in both speeding the response time and limiting the transient seen on the input power bus. Momentary input transients to 6.5V are permitted.

Output voltage undershoot is caused by the inductance of the output power bus just after a short has occurred and the TPS20xxC and TPS20xxC-2 has abruptly reduced OUT current. Energy stored in the inductance will drive the OUT voltage down and potentially negative as it discharges. Applications with large output inductance (such as from a cable) benefit from use of a high-value output capacitor to control the voltage undershoot. When implementing USB standard applications, a 120 µF minimum output capacitance is required. Typically a 150 µF electrolytic capacitor is used, which is sufficient to control voltage undershoots. However, if the application does not require 120 µF of capacitance, and there is potential to drive the output negative, a minimum of 10 µF ceramic capacitance on the output is recommended. The voltage undershoot should be controlled to less than 1.5 V for 10 µs.

POWER DISSIPATION AND JUNCTION TEMPERATURE

It is good design practice to estimate power dissipation and maximum expected junction temperature of the TPS20xxC and TPS20xxC-2. The system designer can control choices of package, proximity to other power dissipating devices, and printed circuit board (PCB) design based on these calculations. These have a direct influence on maximum junction temperature. Other factors, such as airflow and maximum ambient temperature, are often determined by system considerations. It is important to remember that these calculations do not include the effects of adjacent heat sources, and enhanced or restricted air flow.

Addition of extra PCB copper area around these devices is recommended to reduce the thermal impedance and maintain the junction temperature as low as practical. The lower junction temperatures achieved by soldering the pad improve the efficiency and reliability of both TPS20xxC and TPS20xxC-2 parts and the system. The following examples were used to determine the θ_{JA}Custom thermal impedances noted in the THERMAL INFORMATION table. They were based on use of the JEDEC high-k circuit board construction (2 signal and 2 plane) with 4, 1oz. copper weight, layers.

While it is recommended that the DGN package PAD be soldered to circuit board copper fill and vias for low thermal impedance, there may be cases where this is not desired. For example, use of routing area under the IC. Some devices are available in packages without the Power Pad (DGK) specifically for this purpose. The θ_{JA} for the DGN package with the pad not soldered and no extra copper, is approximately 141°C/W for 0.5 - A and 1- A rated parts, and 139°C/W for the 1.5 - A and 2- A rated parts. The θ_{JA} for the DGK mounted per Figure 45 is 110.3C/W. These values may be used in Equation 1 to determine the maximum junction temperature.

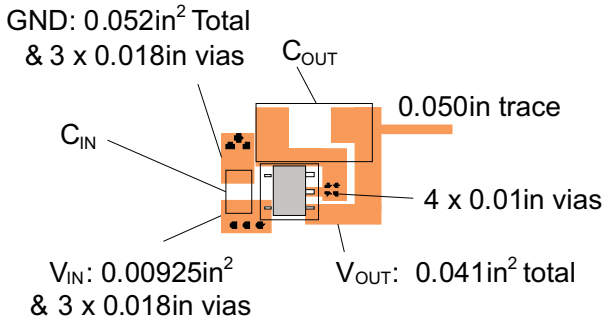

Figure 43. DBV Package PCB Layout Example

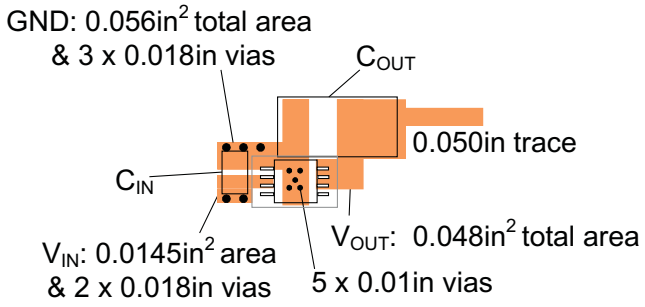

Figure 44. DGN Package PCB Layout Example

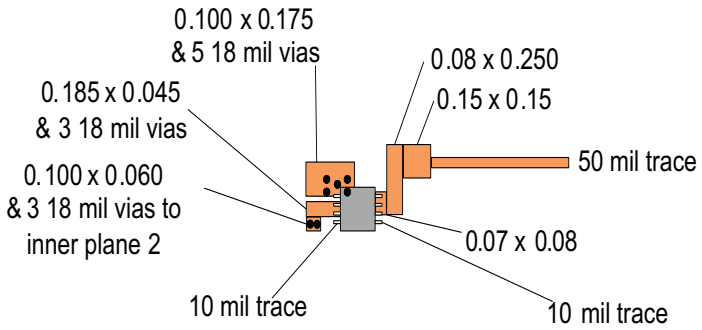

Figure 45. DGK Package PCB Layout Example

The following procedure requires iteration because power loss is due to the internal MOSFET $I^2 \times R_{DS(ON)}$, and $R_{DS(ON)}$ is a function of the junction temperature. As an initial estimate, use the $R_{DS(ON)}$ at 125°C from the TYPICAL CHARACTERISTICS, and the preferred package thermal resistance for the preferred board construction from the THERMAL INFORMATION table.

$$T_J = T_A + ((I_{OUT}^2 \times R_{DS(ON)}) \times \theta_{JA}) \quad (1)$$

Where:

I_{OUT} = rated OUT pin current (A)
$R_{DS(ON)}$ = Power switch on-resistance at an assumed T_J (Ω)
T_A = Maximum ambient temperature (°C)
T_J = Maximum junction temperature (°C)
θ_{JA} = Thermal resistance (°C/W)

If the calculated T_J is substantially different from the original assumption, estimate a new value of $R_{DS(ON)}$ using the typical characteristic plot and recalculate.

If the resulting T_J is not less than 125°C, try a PCB construction and/or package with lower θ_{JA} .

REVISION HISTORY

Changes from Original (June 2011) to Revision A **Page**

- Changed the TPS2051C, TPS2065C, and TPS2069C Devices Status From: Preview To: Active 1
- Corrected pinout numbers for the 5-PIN PACKAGE 7

Changes from Revision A (July 2011) to Revision B **Page**

- Added the DGK Package Information throughout the data sheet 1
- Changed title of Figure 17 From: NEW FIG To: TPS2065C 50 Ω Short Circuit 9

Changes from Revision B (September 2011) to Revision C **Page**

- Changed TPS2000C (MSOP-8) status From: Preview To: Active in Table 1 1
- Changed From: PXF1 To: PXFI and From: PSG1 To: PXGI in the DEVICE INFORMATION table MOSP-8 (DGK) column 2
- Changed the θJACustom 2 A Rated DGK value from N/A to 110.3 2
- Added Figure 45 - DGK Package PCB Layout Example 17

Changes from Revision C (October 2011) to Revision D **Page**

- Added Feature UL Listed and CB-File No. E169910 (See Table 1) 1
- Added table Note 2, UL listed and CB complete. 1
- Added V_{IH} and V_{IL} information to the ROC Table 3

Changes from Revision D (February 2012) to Revision E **Page**

- Changed the POWER DISSIPATION AND JUNCTION TEMPERATURE section. Replaced paragraph " While it is recommended..." 16

Changes from Revision E (April 2012) to Revision F **Page**

- Added device TPS20xxC-2 1
- Changed Feature From: Ouput Discharge When TPS20XXC is Disabled To: Selected parts with (TPS20xxC) and without (TPS20xxC-2) Output Discharge 1
- Added devices TPS2041C, TPS2061C, TPS2065C-2, TPS2068C, and TPS2069C-2 to Table 1 and removed Product Preview 1
- Added the TPS2069C-2 Device 1
- Added devices TPS2041C, TPS2061C, TPS2065C-2, TPS2068C, and TPS2069C-2 to the Device Information table 2
- Added PXKI in the DEVICE INFORMATION table SOT23-5 (DBV) column (TPS2069C) 2
- Added Note 1 to the RECOMMENDED OPERATING CONDITIONS table 3
- Added TPS2041C, TPS2061C, TPS2068C, TPS2065C-2 and TPS2069C-2 devices to I_{OUT} in the RECOMMENDED OPERATING CONDITIONS table 3
- Added the DBV option to Power Switch $R_{DS(on)}$ 1.5 A rated output, 25°C mΩ 3
- Added the DBV option to Power Switch $R_{DS(on)}$ 1.5 A rated output 3
- Changed I_{SO} Current Limit 3
- Added Leakage Current 3
- Added the DBV option to Power Switch $R_{DS(on)}$ 1.5 A rated output 4
- Changed I_{SO} Current Limit 4
- Added Leakage Current 5
- Changed the second para graph of the ENABLE section 14
- Added sentence to end of paragraph in the OUTPUT DISCHARGE section 15

Changes from Revision F (August 2012) to Revision G **Page**

- Deleted (See Table 1) from Feature: UL Listed and CB-File No. E169910 1
- Deleted Note 2 from Table 1: "UL listed and CB complete" 1
- Changed From: PXKI To: PYKI in the DEVICE INFORMATION table SOT23-5 (DBV) column (TPS2069C) 2

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

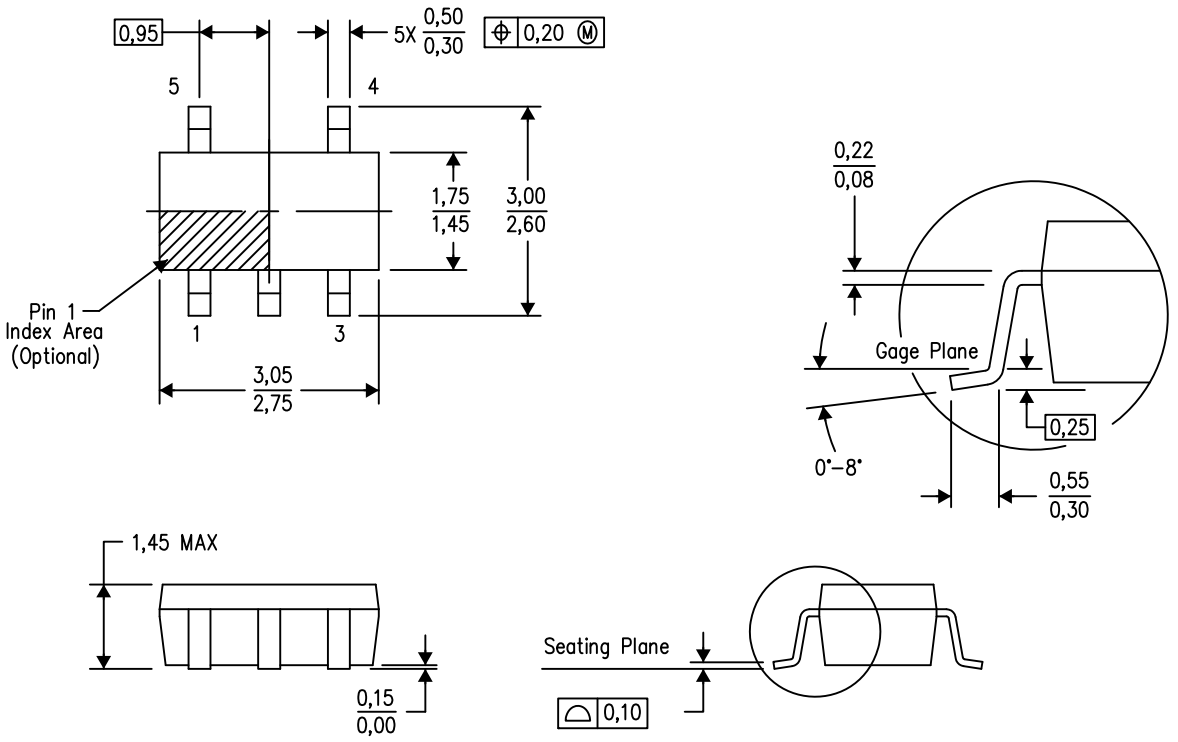
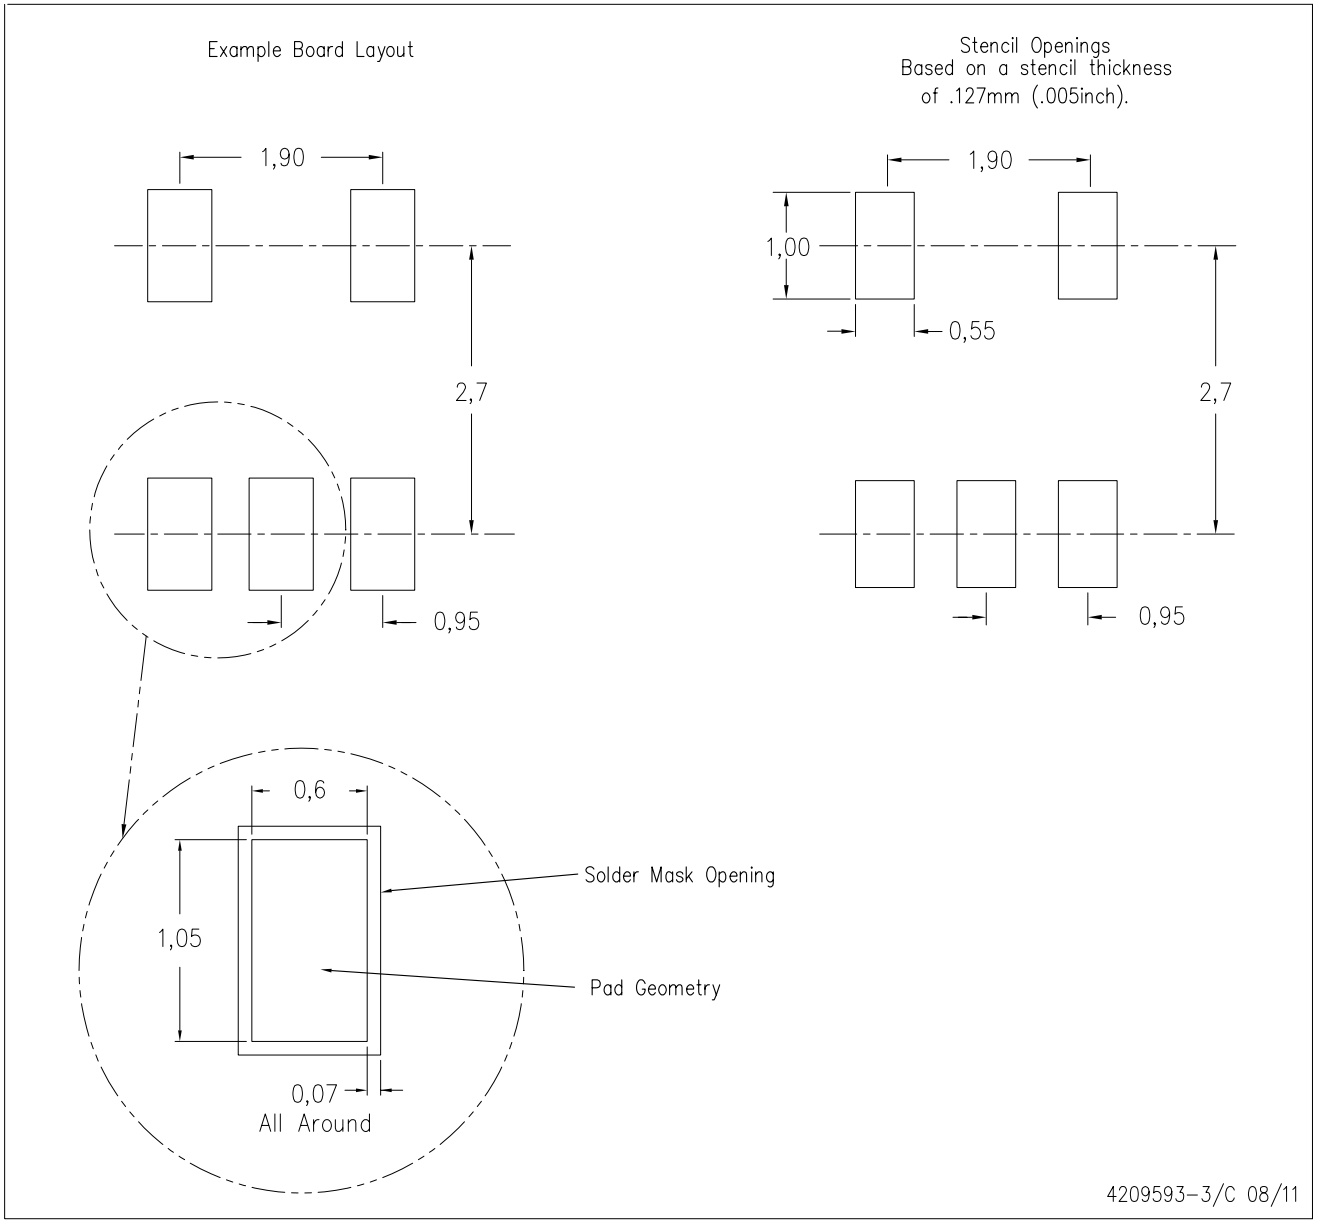
DBV (R–PDSO–G5) PLASTIC SMALL–OUTLINE PACKAGE



4073253–4/L 08/2013

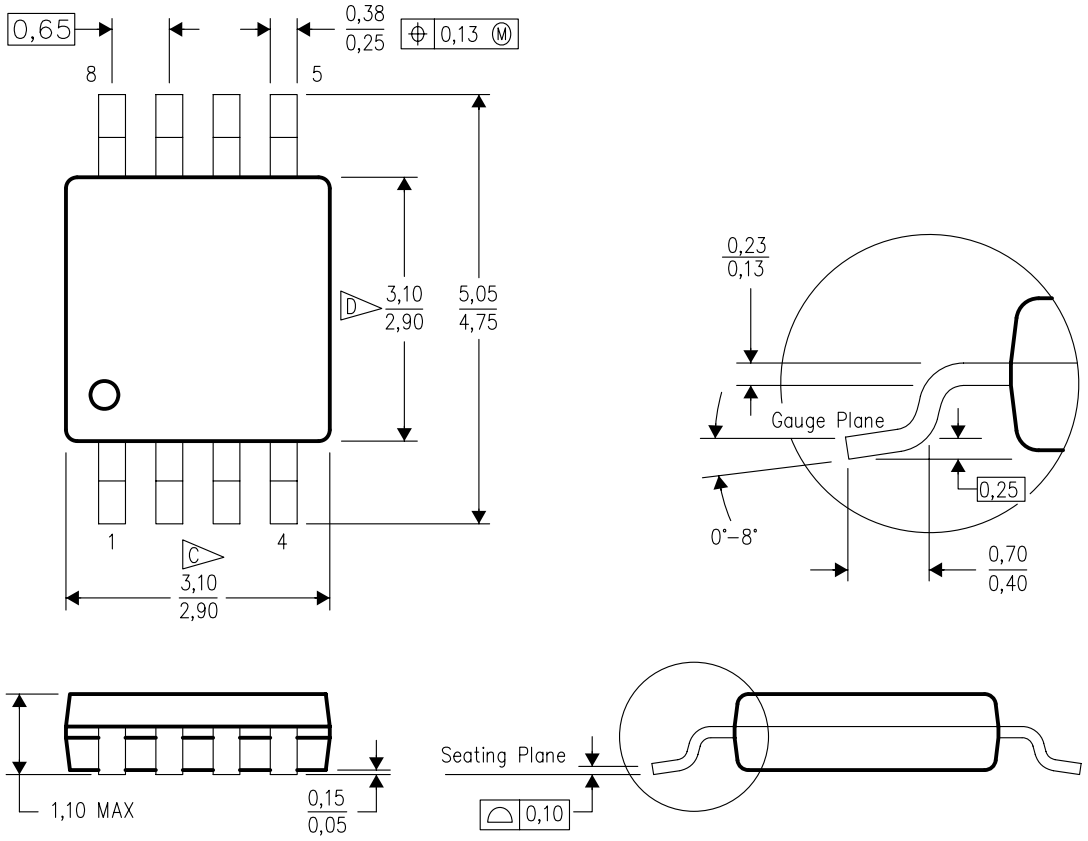
NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.15 per side.
D. Falls within JEDEC MO–178 Variation AA.

DBV (R–PDSO–G5) PLASTIC SMALL OUTLINE



NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
D. Publication IPC–7351 is recommended for alternate designs.
E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC–7525 for other stencil recommendations.

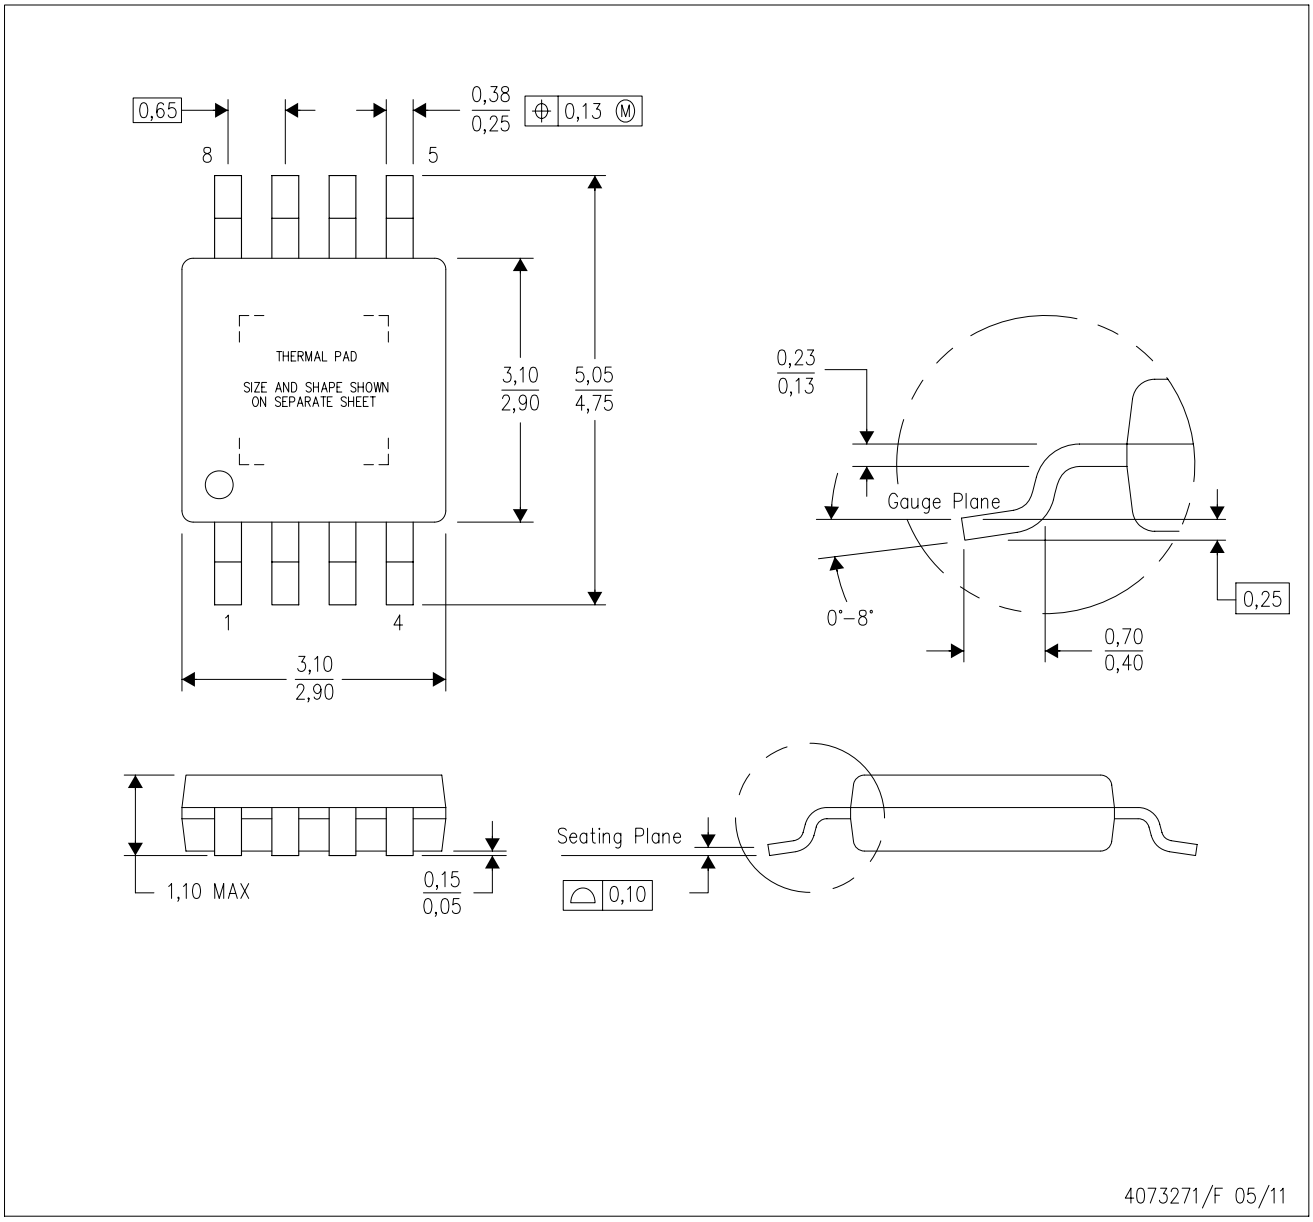
DGK (S–PDSO–G8) PLASTIC SMALL–OUTLINE PACKAGE



4073329/E 05/06

NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 per end.
D. Body width does not include interlead flash. Interlead flash shall not exceed 0.50 per side.
E. Falls within JEDEC MO–187 variation AA, except interlead flash.

DGN (S–PDSO–G8) PowerPAD™ PLASTIC SMALL OUTLINE



NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Body dimensions do not include mold flash or protrusion.
D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <http://www.ti.com>.
E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
F. Falls within JEDEC MO–187 variation AA–T

PowerPAD is a trademark of Texas Instruments.

DGN (S–PDSO–G8) PowerPAD™ PLASTIC SMALL OUTLINE

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

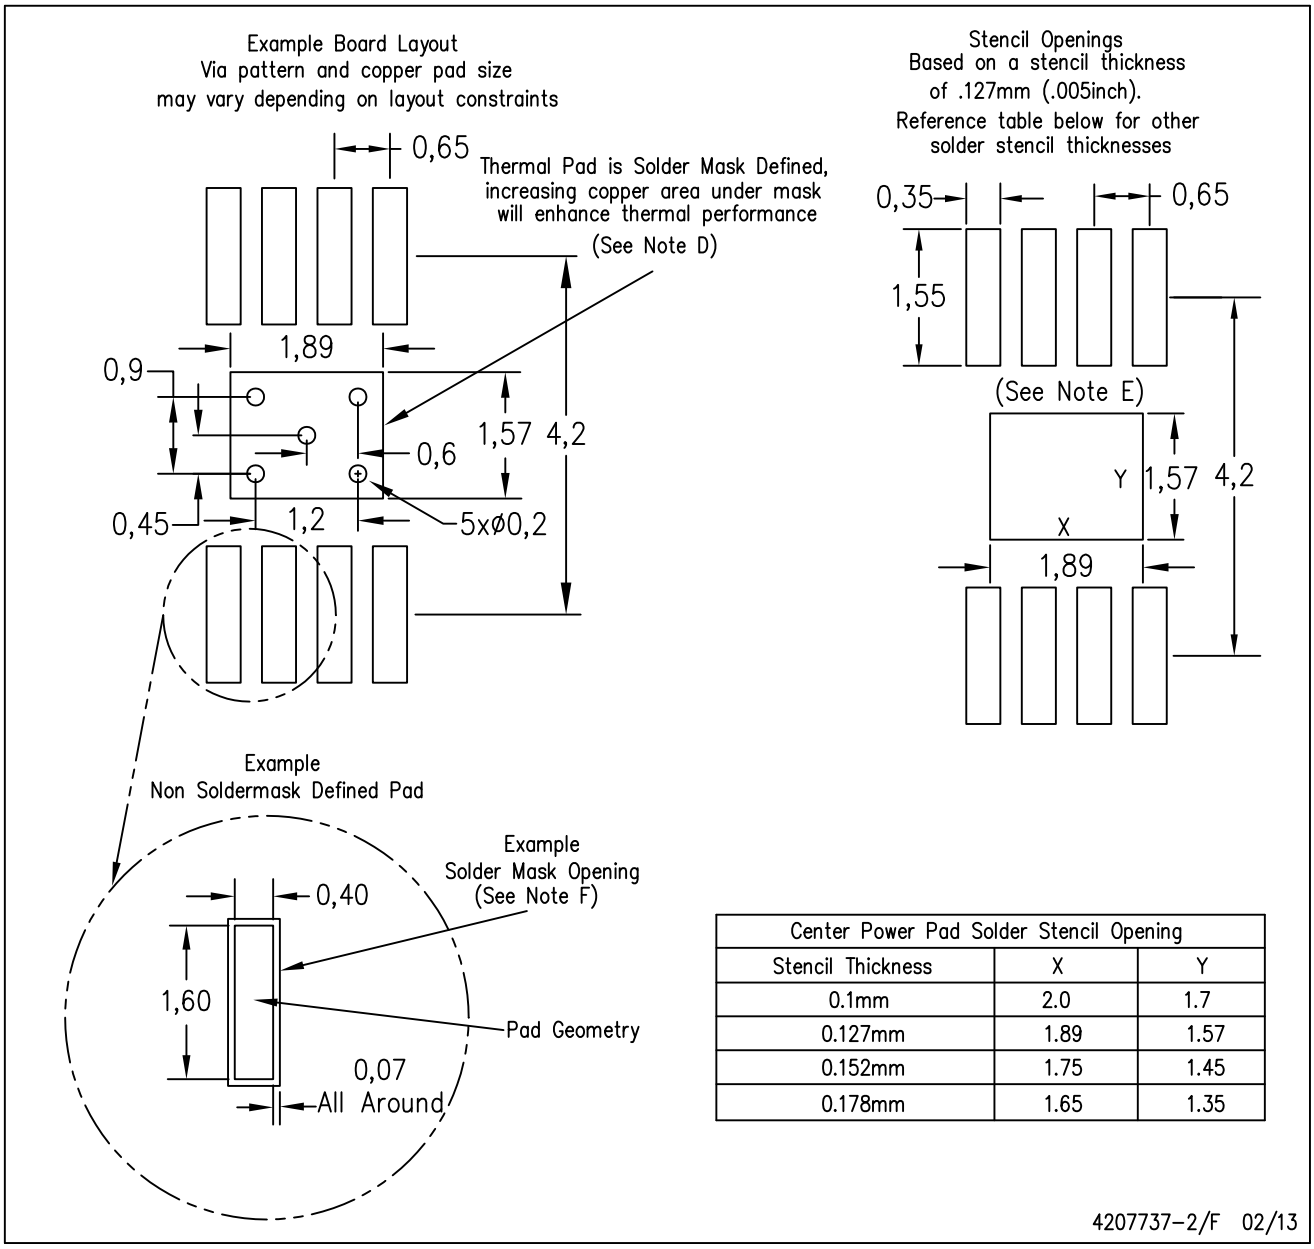
DGN (R–PDSO–G8) PowerPAD™ PLASTIC SMALL OUTLINE



Center Power Pad Solder Stencil Opening		
Stencil Thickness	X	Y
0.1mm	2.0	1.7
0.127mm	1.89	1.57
0.152mm	1.75	1.45
0.178mm	1.65	1.35

4207737–2/F 02/13

NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <http://www.ti.com>.
E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC–7525 for other stencil recommendations.
F. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as “components”) are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI’s terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers’ products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers’ products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI’s goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have ***not*** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
